TITLE OF INVENTION

METHOD FOR AUTOMATICALLY MATCHING THE LEVELS OF THE SIGNALS EXCHANGED IN A  
COMMUNICATION NETWORK

APPLICANT(S) FOR DO/EO/US

THOMSON MULTIMEDIA

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This is an express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(1).
4. ☒ A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.
5. ☒ A copy of the International Application as filed (35 U.S.C. 371 (c) (2))
  - a. ☐ is transmitted herewith (required only if not transmitted by the International Bureau).
  - b. ☒ has been transmitted by the International Bureau.
  - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ A translation of the International Application into English (35 U.S.C. 371(c)(2)).
7. ☒ A copy of the International Search Report (PCT/ISA/210).
8. ☐ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371 (c)(3))
  - a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
  - b. ☐ have been transmitted by the International Bureau.
  - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
  - d. ☐ have not been made and will not be made.
9. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
10. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371 (c)(4)).
11. ☐ A copy of the International Preliminary Examination Report (PCT/IPEA/409).
12. ☐ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371 (c)(5)).

Items 13 to 18 below concern document(s) or information included:

13. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
14. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
15. ☒ A **FIRST** preliminary amendment.  
A **SECOND** or **SUBSEQUENT** preliminary amendment.
16. ☐ A substitute specification.
17. ☐ A change of power of attorney and/or address letter.
18. ☒ Certificate of Mailing by Express Mail
19. ☒ Other items or information:

CERTIFICATE OF MAILING UNDER 37 CFR 1.10

**PRELIMINARY AMENDMENT**

Honorable Assistant Commissioner for Patents  
Washington, D.C. 20231

Dear Sir:

In the US national phase application of PCT/FR98/00295 filed  
herewith, please enter the following amendments:

In the Specification:

Please amend the specification (which are the annexes of the International  
Preliminary Examining Report) as follows:

On Page 1, at line 16, delete [station] and insert exchange.

On Page 2, before line 14, please insert the following paragraph:

-- Document US 5422950 (Miller et al.) relates to the automatic  
compensation for attenuations in a telephone system. The estimate of the  
impedance of the line is made by measuring the voltage on the lines 28, 30 for a  
particular current using a simple resistance-measuring circuit 42. The subject  
matter of document US 422950 does not solve the problem mentioned above. --

On Page 4, at line 24, delete [station] and insert exchange.

In the Claims

Please amend the claims (which are annexes of the International Preliminary Examining Report) as follows:

In Claim 1, line 4, delete [(IN1, OUT2)],  
line 5 delete [(3)] and [(4)],  
line 6, delete [(2)],  
line 7, delete [(6)],  
line 9, delete [(OUT2)],  
line 10, delete [(6)],  
line 11, delete [(2)],  
line 13, delete [(IN1, OUT2)],  
line 14, delete [(6)],  
line 15, delete [(K)] and [(OUT2)],  
line 16, delete [(IN1)],  
line 18, delete [(IN1, OUT2)],  
line 19, delete [(G1, G2)],  
line 20, delete [(K)].

In Claim 2, line 24, delete [(K)],  
line 30, delete [(6)],  
line 31, delete [(6)],  
line 35, delete [G2].

In Claim 3, line 1, delete [or 2],  
line 2, delete [(G2)] and [(OUT2)],  
line 4, delete [(IN2)],  
line 5, delete [(OUT2)],  
line 6, delete [(ZL)].

In Claim 4, line 8, delete [one of Claims 1 to 3], and insert Claim 1,  
line 9, delete [(G1)] and [(IN1)],  
line 11, delete [(IN1)] and [(OUT2)],  
line 13, delete [(ZL)].

In Claim 5, line 14, delete [one of Claims 3], and insert Claim 3..

In Claim 6, line 18, delete [(IN1, OUT2)],  
line 19, delete [(3)] and [(4)],  
line 20, delete [(6)],  
line 21, delete [(46)].  
line 22, delete [(OUT2)],  
line 23, delete [(3)],  
line 24, delete [(40)],  
line 26, delete [(10)].  
line 27, delete [(OUT2)],  
line 28, delete [(IN1)],  
line 29, delete [(IN1, OUT2)].

In Claim 7, line 34, delete [(10)] and [(12)],  
line 35, delete [(K)],  
line 36, delete [(14)],  
line 37, delete [(16)] and [(G1)],  
line 38, delete [(IN1)],  
line 17, delete [(82)],  
line 19, delete [(85)],  
line 20, delete [(88)],  
line 22, delete [(90)],  
line 1, delete [(18)] and [(G2)],  
line 2, delete [(OUT2)].

In Claim 8, line 4, delete [one of Claims 5 to 7] and insert Claim 5,  
line 5, delete [(10)],

In Claim 10, line 10, delete [(3)],  
line 11, delete [one of Claims 6 to 9] and insert Claim 6.

#### In the Abstract

Please add the attached abstract and delete the following:

At line 6, delete [(OUT2)] and [(6)],  
line 7, delete [(2)],

line 8, delete [(IN1, OUT2)] and [(6)],  
line 9, delete [(K)] and [(OUTS)],  
line 10, delete [(IN1)],  
line 11, delete [(IN1, OUT2)] and [(G1, G2)],  
line 12, delete [(K)],

## ABSTRACT

The invention concerns a method and a device for automatically adapting the levels of signals exchanged in a telephone network, between a first set and a second set. The method is characterised in that it consists in the following steps: digitising the signal (OUT2) coming from the transmission line (6) and received by the first set (2); on the basis of the digital data translating the signals (IN1, OUT2) exchanged with the transmission line (6), estimating the transfer function (K) equal to the ratio of the signal (OUT2) received by the first set over the signal (IN1) transmitted by the first set; respectively multiplying each of the exchanged signals (IN1, OUT2) by an appropriate gain (G1, G2) determined on the basis of the estimated value of said transfer function (K). The invention is particularly applicable to telephones, videophones, fax machines or computers connected to a communication network.

REMARKS

The above claims have been amended to remove reference indicia and multiple dependencies. No new matter has been added.

To meet the requirements of the United States, the Abstract is added. The abstract as amended during the prosecution of the PCT application has been amended to remove reference indicia.

No fee is believed to be incurred by virtue of this amendment. However, if a fee is incurred on the basis of this amendment, please charge such fee against deposit account 07-0832.

Respectfully Submitted,  
Christophe Lorin

METHOD FOR AUTOMATICALLY MATCHING THE LEVELS OF THE  
SIGNALS EXCHANGED IN A COMMUNICATION NETWORK

2/PRTS

The present invention relates to a method for  
5 automatically matching the levels of the signals  
exchanged between apparatuses such as telephones,  
videophones (system for transmitting voice and video  
via the telephone network), faxes or computers which  
are connected to a communication network. The invention  
10 also relates to an automatic matching device.

The invention relates in particular to a method  
for automatically matching the levels of the signals  
exchanged in a telephone network.

Figure 1 schematically represents a subscriber  
15 loop 2 in a known architecture of a telephone network,  
connecting a user to a telephone station 4. The user  
transmits a signal IN1 and receives a signal OUT2  
through a transmission line 6 which is represented by  
its impedance  $Z_L$ . This impedance has a detrimental  
20 effect on the signals exchanged between the user and  
the station.

One solution for correcting the distortions  
introduced by the analogue transmission line consists  
in measuring a DC voltage  $V_{dc}$  across the terminals of a  
25 load 7 which is connected to the line through an  
inductor L1, given that the capacitors C1, C2 act as  
filters for low-frequency signals while the inductors  
L1, L2 filter the high-frequency signals. This voltage  
 $V_{dc}$  is then delivered to a calculation module 8 which,  
30 on the basis of the result of this measurement, deter-  
mines a value for  $Z_L$ . The calculation module also  
determines a gain G1, chosen so that the gain of IN1 at  
the point VL2 does not depend on  $Z_L$ , a gain G2, chosen  
so that the gain of IN2 in the signal OUT2 does not  
35 depend on  $Z_L$  either, and a gain G3 which is chosen so  
as to suppress the sent signal IN2 from the received  
signal OUT2 and acts as an echo canceller (G3 is not  
shown in Figure 1).

It can be determined that:

$$OUT2 = \frac{IN1}{2} * \left[ \frac{Z_L}{Z_L + 2R_1} \right] + IN2 * \left[ \frac{R_1}{Z_L + 2R_1} \right]$$

In this case, setting:

$$G1 = G2 = \frac{Z_L}{2R_1} + 1$$

and

$$G3 = 2 * \frac{Z_L + R_1}{Z_L + 2R_1}$$

the following are obtained:  $OUT1 = 0.5 * IN1$  and  $OUT2 = 0.5 * IN2$

This solution is not suitable for compensating the signals exchanged by digital apparatuses, which need to be isolated from the subscriber loop and which do not therefore have access to the line impedance  $Z_L$  via a direct voltage/current measurement.

The object of the invention is to reduce the effect of the line impedance, and to do so even though the direct measurement described above is impossible.

This object is achieved by a method for automatically matching the levels of the signals exchanged between a first apparatus and a second apparatus which communicates with the said first apparatus via a transmission line, characterized in that it comprises the following steps:

- the signal which comes from the transmission line and is received by the first apparatus (2) is digitized,

- on the basis of the digital data representing the signals exchanged with the transmission line, an estimate is made of the transfer function equal to the ratio of the signal received by the first apparatus to the signal ( $IN1$ ) transmitted by the first apparatus,

- each of the exchanged signals ( $IN1$ ,  $OUT2$ ) is respectively multiplied by a suitable gain ( $G1$ ,  $G2$ ) determined on the basis of the estimated value of the said transfer function ( $K$ ).

With the method according to the invention, it is no longer necessary to measure a DC voltage in order

to determine the gains needed for the compensation, since the solution employed is essentially digital, that is to say software-based, and can therefore be employed for compensating the level of the signals exchanged in applications using digital apparatuses which are isolated from the subscriber loop, such as videophones, faxes or computers. The method allows, dynamically, operation in full duplex mode which is independent of temperature variations so long as at least one signal transmission out from the apparatus has been made in order to ascertain the initial characteristics of the line.

It may be advantageous for the numerical estimate making it possible to evaluate the transfer function (K) to be made using a software calculation method.

According to one embodiment, this calculation method implements an identification algorithm.

Preferably, the identification algorithm is of the LMS (Least Mean Square), RLS (Recursive Least Square) or Kalman type.

The invention also relates to a device for automatically matching the levels of signals exchanged between a first apparatus (3) and a second apparatus communicating via a transmission line, characterized in that it has:

- an analogue/digital converter capable of digitizing a signal entering the first apparatus,
- a digital/analogue converter capable of converting a signal transmitted by the first apparatus,
- a calculation block intended to estimate the ratio of the incoming signal to the signal transmitted by the first apparatus, and to determine the gains needed for matching the levels of the signals transmitted and received by the first apparatus, the said gains being dependent on the said ratio.

According to one embodiment, the numerical calculation block has a unit for identifying the transfer function interacting with a calculation module

which is intended to supply a first amplification means with the first gain for matching the level of the signal transmitted by a user, and to supply a second amplification means with the second gain for matching  
5 the level of the signal received by the user.

Advantageously, the calculation block is a DSP (Digital Signal Processing) circuit implementing an identification algorithm.

Other characteristics and advantages of the  
10 invention will become apparent from the following description, made by way of nonlimiting example and with reference to the appended figures, in which

- Figure 1, already described, schematically represents a subscriber loop in a telephone network  
15 according to a prior art architecture,

- Figure 2 schematically represents a subscriber loop in a telephone network having a device for automatically matching the levels of the signals exchanged according to the invention, and

20 - Figure 3 schematically represents a similar subscriber loop to Figure 2, implementing an echo canceller.

Figure 2 schematically illustrates a link between a apparatus 3 of a user and a telephone station  
25 4 via a transmission line 6 which is represented by its impedance  $Z_L$ . The user transmits a signal IN1 and receives a signal OUT2, while the station 4 transmits a signal IN2 and receives a signal OUT1.

In order to avoid the attenuation due to the  
30 impedance  $Z_L$  of the line 6 which the signals IN1 and OUT2 suffer, and in order to keep the transfer functions for the signal IN1, at the point VL2, and for the signal OUT2 independent of the line impedance, the method according to the invention has a step of  
35 digitizing the signal entering the said apparatus, a step of estimating the transfer function K as a function of the exchanged signals OUT2 and IN1, then a step of multiplying each signal by a suitable gain

determined on the basis of the value of the transfer function K determined beforehand.

When the signal IN1 is transmitted, the signal OUT2 detected at the output of the subscriber loop is applied to an analogue/digital converter 44 which digitizes the said signal OUT2.

The estimate of the transfer function K is made numerically by an identification algorithm based, for example, on the method of least squares, the RLS (Recursive Least Square) algorithm or alternatively on the Kalman algorithm. The algorithm has the function of calculating the characteristic parameters of the transfer function K, which may in particular be a matrix  $(h_1)_{1 \leq i \leq n}$  or a polynomial fraction in  $(Z_L^{-1})_{1 \leq i \leq n}$ .

In the present embodiment, the calculation consists in firstly determining the ratio:

$$\frac{OUT2}{IN1} = K(Z_L) + \varepsilon$$

where

$$K(Z_L) = \frac{Z_L}{2 \cdot (Z_L + 2 \cdot R_1)}$$

This being true in the present embodiment with an impedance  $Z_L$  which is assumed to be constant. It is clear that the source impedance is equal to the input impedance of the line for a short line  $Z_L=0$  and the input impedance of the line is dependent on the characteristic impedance  $Z_c$  and on the load impedance  $Z_R$ ; in the present case,  $Z_R$  is equal to the source impedance  $R_1$ . For the sake of simplicity, the condition  $Z_L=Z_c$  is set.

A step subsequent to this calculation consists in determining:

for the transmitter signal, a first gain

$$G1(Z_L) = \frac{Z_L}{2R_1} + 1 = \frac{1}{1 - 2 \cdot K(Z_L)}$$

and for the received signal, a second gain

$$G2(Z_L) = \frac{1}{1 - 2 \cdot K(Z_L)}.$$

It can be seen that for these values of gains, the voltage OUT2 at the ends of the transmission line

is equal to half the voltage VL2 (apart from echoes of IN1).

The device in Figure 2 has a numerical calculation block 10 intended to estimate the impedance  $Z_L$  of the transmission line and to determine the gains needed for compensating the exchanged signals. This numerical calculation block 10 has a unit 12 for identifying the transfer function K interacting with a calculation module 14 which is intended to supply a first amplification means 16 with the first gain G1 for compensating for the attenuation of the signals transmitted by the user, and to supply a second amplification means 18 with a second gain G2 for compensating for the attenuation of the signal received by the user.

Preferably, the numerical calculation block 10 is a DSP (Digital Signal Processing) circuit employing one of the identification algorithms mentioned above. Another type of circuit may, of course, be used.

As can be seen in Figure 2, a first input 20 of the identification unit 12 is connected to the output 21 of the first amplification means 16, while a second input 22 of the said identification unit 12 is connected to a first input 23 of the second amplification means 18. The output 24 of the identification unit 12 is connected to the input 26 of the calculation module 14. A first output 28 of the calculation module 14 is connected to a first input 30 of the first amplification means 16, while a second output 32 of the calculation module 14 is connected to a second input 34 of the second amplification means 16. The output 36 of the numerical calculation block 10 is connected to an input 38 of a digital/analogue converter 40, while the input 42 of the said numerical calculation block 10 is connected to the output 44 of an analogue/digital converter 46.

During operation, the identification unit 12 supplies the calculation module 14 with an estimated value of the transfer function K, calculated on the

basis of the values of the signals transmitted and of the signals received by the user. These signals are applied respectively to the first input 20 and to the second input 22 of the identification unit 12.

5       The calculation module 14 supplies the first amplification means 16 with the first gain  $G_1$  in order to compensate for the attenuation of the signals transmitted by the user, and supplies the second amplification means 18 with the second gain  $G_2$  in order  
10 to compensate for the attenuation of the signals received by the user.

      The method and the device of the invention thus make it possible to perform automatic matching of the levels of the signals exchanged through a transmission  
15 line. Furthermore, this system is not sensitive to temperature drifts which can affect the voltage measurement advocated in the prior art, such as that across the terminals of the load 7 in Figure 1. The method is thus independent of the variations in the  
20 power source X of the telephone network.

      Knowledge of the transfer function  $K(Z_1)$  can also be used to detect the presence of a parallel connection of the device of the invention in the transmission line. The said detection method includes a  
25 step of observing the sign of the gain of the identified transfer function  $K$ . When the sign is negative, then it is deduced that a second set is connected in parallel with the transmission line. This information can be used, for example, without implying  
30 any limitation, for security reasons in the case of using a modem and a telephone. If detection is made by the modem then the latter can hang up to free the line.

      Figure 3 is similar to Figure 2, with the same elements having the same references. However, echo-cancelling means are furthermore introduced into the  
35 device. In practice, this is equivalent to making OUT2 independent of IN1. To that end, a third gain,  $G_3$ , is introduced which is applied to IN1 by means of an amplifier 49. The whole is subtracted from OUT2 by a

subtractor 50, before amplification by G2. It can be shown that, in order to cancel the echo, it is necessary that  $G3=K(Z_L)$ .

# CLAIMS

1. Method for automatically matching the levels of the signals (IN1, OUT2) exchanged between a first  
5 apparatus (3) and a second apparatus (4) which communicates with the said first apparatus (2) via a transmission line (6), characterized in that it comprises the following steps:

- the signal (OUT2) which comes from the  
10 transmission line (6) and is received by the first apparatus (2) is digitized,

- on the basis of the digital data representing the signals (IN1, OUT2) exchanged with the transmission line (6), an estimate is made of the transfer function  
15 (K) equal to the ratio of the signal (OUT2) received by the first apparatus to the signal (IN1) transmitted by the first apparatus,

- each of the exchanged signals (IN1, OUT2) is respectively multiplied by a suitable gain (G1, G2) determined on the basis of the estimated value of the said transfer function (K).

2. Method according to Claim 1, characterized in that it comprises the following steps:

- the estimate of the transfer function (K)  
25 defined in the following way is made:

$$\frac{OUT2}{IN1} = K(Z_L) + \varepsilon$$

where

$$K(Z_L) = \frac{Z_L}{2 \cdot (Z_L + 2 \cdot R_1)}$$

and  $Z_L$  represents the impedance of the  
30 transmission line (6), while  $R_1$  represents the source impedance of the transmission line (6),

- the following are calculated:

for the transmitter signal, the first gain G1

$$G1(Z_L) = \frac{1}{1 - 2 \cdot K(Z_L)}$$

35 and for the received signal, the second gain G2

$$G2(Z_L) = \frac{1}{1 - 2 \cdot K(Z_L)} .$$

3. Method according to Claim 1 or 2, characterized in that the gain (G2) of the signal (OUT2) received by the first apparatus is chosen so that the component of the signal transmitted by the second apparatus (IN2) in the signal (OUT2) received by the first apparatus is independent of the impedance (ZL) of the transmission line.

4. Method according to one of Claims 1 to 3, characterized in that the gain (G1) of the signal (IN1) transmitted by the first apparatus is chosen so that the component of this signal (IN1) in the signal (OUT2) received by the second apparatus is independent of the impedance (ZL) of the transmission line.

5. Method according to one of Claims 3, characterized in that the said calculation method implements an identification algorithm.

6. Device for automatically matching the levels of signals (IN1, OUT2) exchanged between a first apparatus (3) and a second apparatus (4) communicating via a transmission line (6), characterized in that it has:

- an analogue/digital converter (46) capable of digitizing a signal (OUT2) entering the first apparatus (3),
- a digital/anologue converter (40) capable of converting a signal transmitted by the first apparatus,
- a calculation block (10) intended to estimate the ratio of the incoming signal (OUT2) to the signal (IN1) transmitted by the first apparatus, and to determine the gains (G1, G2) needed for matching the levels of the signals transmitted and received by the first apparatus (IN1, OUT2), the said gains being dependent on the said ratio.

7. Device according to Claim 6, characterized in that the block (10) has a unit (12) for identifying the transfer function (K) interacting with a calculation module (14) which is intended to supply a first amplification means (16) with the first gain (G1) for matching the level of the signal (IN1) transmitted by the first apparatus, and to supply a second

amplification means (18) with the second gain (G2) for matching the level of the signal (OUT2) received by the first apparatus.

8. Device according to one of Claims 5 to 7, characterized in that the calculation block (10) has a DSP circuit implementing an identification algorithm.

9. Device according to Claim 8, characterized in that the identification algorithm is of the LMS, RLS or Kalman type.

10. Communication apparatus (3), characterized in that it has a device according to one of Claims 6 to 9.

## ABSTRACT

### METHOD FOR AUTOMATICALLY MATCHING THE LEVELS OF THE SIGNALS EXCHANGED IN A COMMUNICATION NETWORK

The invention relates to a method and to a device for automatically matching the levels of the signals exchanged in a telephone network, between a first apparatus and a second apparatus.

The method according to the invention comprises the following steps:

- the signal (OUT2) which comes from the transmission line (6) and is received by the first apparatus (2) is digitized,

- on the basis of the digital data representing the signals (IN1, OUT2) exchanged with the transmission line (6), an estimate is made of the transfer function (K) equal to the ratio of the signal (OUT2) received by the first apparatus to the signal (IN1) transmitted by the first apparatus,

- each of the exchanged signals (IN1, OUT2) is respectively multiplied by a suitable gain (G1, G2) determined on the basis of the estimated value of the said transfer function (K).

Particular application to telephones, video-phones, faxes or computers which are connected to a communication network.
